

Client-Government App

Business

1. User Management Data
2. Live Map Data
 - A. Velocity Layer
 - B. Pollution Layer
3. AI-Assistent suggestion to solve the problem
4. Comparison of Score and Actual Statement

Data

1. UserData: LiveUserData, AggregateUserData
2. Data OSM
3. Public sensor data
4. Environmental Data to feed the AI

Technology

1. Get Live User Data and Plot it in the OSM
2. To get the Pollution Score, get the User Data and Public Sensor Data
3. User Management Data: Use the Aggregate User Date
4. Comparison of Score: Get the Environmental Data + Public Indicator According to EU + AggregateUserData
5. AI-Assistent: Return Expert Knowledge of Traffic Jam and Solution. It should get the data of our live map data
- 6.

Client-Driver

Business

1. Navigation Dashboard (and Map)
2. Impact Dashboard
3. Benefitsy for User
4. Result of Speed Calculation
5. Result of Closes Way

Data

1. Impact Dashboard: User Data before, User Data After
2. Data OSM
3. Benefitsy: User Data and 3rd party benefit data (?)
4. Calculation Data (from our backend)

Technology

7. According to the result, create a navigation dashboard (using ?)
8. Comparison of Before and After User Data: use before user data and after user data
9. Result of Speed Calculation: Calculation Data
10. Result of Closes Way: Calculation Data

Design Architecture of Application

1. Tech Stack: React Native, Tailwind.css, TS(?), Postgres, C#, REST-API
- 2.
